

2.3.1 Student Centric Methods

Problem-solving methodology

Using case studies as a problem-solving methodology is an effective educational strategy that provides students with real-world scenarios to apply theoretical knowledge and develop critical thinking skills. This approach involves analyzing specific instances of problems, identifying underlying issues, proposing solutions, and evaluating the outcomes. Employing case studies in problem-solving equips our students with the essential tools to tackle real-world challenges effectively. This method not only enhances their academic learning but also prepares them for professional environments, where they can apply their skills to solve complex problems innovatively and efficiently.
